

Thank you for calling 1-800-GET-TESTED®

Our mission for the past 25 years has been focused on referring callers to providers of the highest quality, most cost-effective and most important medical testing services. We do this as a public service because proactive testing is the key that opens the door to early detection of disease for people who may have no symptoms of the disease. And early detection paves the way for a much greater likelihood of successful treatment, and in some cases, saving lives.

We've dedicated most of our efforts over the years to sharing information about silent epidemics -- highly prevalent diseases that remain largely undiagnosed with no obvious symptoms until much later in the disease progression when treatment options may be limited and the prognosis may be poor.

Chronic liver disease, for example, is a silent epidemic that affects approximately one third of the entire adult population in the United States. Many people who had been living with chronic liver disease for years never knew they were living with it until symptoms finally appeared and a series of diagnostic tests led to a diagnosis of liver cancer.

We are certainly not suggesting that everyone should go running out right now to get tested for liver cancer, but we would like you to at least be aware of the fact that screening for liver cancer is now possible with a simple blood test. The take-home message here is that early detection can be a lifesaving discovery for patients whose cancer might have gone undetected until much later in the disease progression.

There are actually a few blood tests that have been developed to screen for liver cancer, and one test in particular captured our attention while we were researching liver cancer screening tests because the validated performance of this test is quite impressive.
